The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-21 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claims 1 and 13 “the energy self-absorption properties” lacks positive antecedent basis. Further the term exact meaning of the term “specifically associated with the energy self absorption properties...” is unclear, as the term “associated with” implies some sort of loose correlation, thus the degree to which the loose correlation with the energy self-absorption properties is refined or made more direct by the modifier “specifically” is unclear. Claims 15 and 21 are incomplete, as the recited steps do not result in the production of an energy delivery device, as recited in the preambles thereof.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Richie et al in combination with Yates et al and Takayama et al. Richie et al teach the use of memory devices to store fiber characteristics. Yates et al teach the desirability of employing fluorescent temperature sensors that have greater stability and repeatability between laser systems. Takayama et al teach that the absorption properties of the optical fibers alter the output of temperature measuring devices employing the fibers. It would have been obvious to the artisan

or ordinary skill to employ the temperature sensor of Yates in the device of Richie et al, since these have greater stability and repeatability between laser systems, as taught by Yates et al, and to include data related to the absorption characteristics of the fiber, since this would be part of the calibration process, as taught by Takayama et al, thus producing a device and method such as claimed.
